## **PREFACE**

This document is compiled by Stichting MRPI® (MRPI®) and NMD Foundation, represented by:

|                               |                         |
|-------------------------------|-------------------------|
| Tom de Boer, MSc:             | Senior data manager NMD |
| Jara Schulz, Msc:             | Data manager NMD        |
| Ir. Jan-Pieter den Hollander: | Managing director MRPI® |

### **ABOUT MRPI®**

MRPI® is an independent non-profit organization founded in 1999 by NVTB ([www.nvtb.nl](http://www.nvtb.nl)), the Dutch Association for the Construction Supply in co-operation with the Dutch government.

In 2014 MRPI® was one of the founding partners of the European ECO Platform. Currently MRPI® is the Dutch program operator issuing MRPI®-EPDs.

MRPI®-EPD certificates are used by leading producers that want to profile their sustainable building products and want to ensure customers that the environmental information is controlled and independently verified. MRPI®-EPD certificates are published at [www.mrpi.nl/epd-certificaten](http://www.mrpi.nl/epd-certificaten), at the ECO Portal and multiple product databases, such as the Dutch National Environmental Database.

### **ABOUT NMD FOUNDATION AND DETERMINATION METHOD**

The Dutch National Environmental Database (NMD) Foundation has been established as an independent organization to manage and maintain the Determination Method for the Environmental Performance of Construction Works (Bepalingsmethode or PCR-NL) with the accompanying database (NMD) for determining the environmental performance of buildings and civil engineering projects. The Determination Method has been developed to calculate the material-related environmental performance of buildings and civil engineering works over their entire life cycle in a clear and verifiable manner. The Determination Method forms a coherent whole with the NMD and the calculation rules. To account for the Dutch context, The Determination Method prescribes additional requirements compared to EN 15804+A2; hence it is also referred to as the PCR-NL.

## 1. INTRODUCTION

This document lists the specific requirements that must be satisfied in order to be able to develop MRPI®-EPDs for the Dutch market and which, additionally, can be included in the Dutch National Environmental Database (Nationale Milieudatabase), hereafter referred to as 'NMD'. The aim of this document is to ease the LCA-review process by integrating the two verification checklists of MRPI® and NMD Foundation into one verification checklist. Since the Determination Method prescribes additional LCA-requirements compared to EN 15804+A2 (and thus compared to MRPI®-EPDs), additional information needs to be verified.

This document is based on an analysis<sup>1</sup> in which the verification protocols of MRPI® and the NMD Foundation were compared. Additionally, this document has been reviewed by recognized verifiers from both Stichting MRPI and the NMD Foundation. The original MRPI-verification protocol can be found at [www.mrpi.nl](http://www.mrpi.nl) and for more information on the NMD-verification protocol, see [www.milieudatabase.nl](http://www.milieudatabase.nl).

The MRPI-verification checklist Part A (Calculation rules for the Life Cycle Assessment and requirements on the LCA project report) served as starting point for the LCA-verification checklist described in this document. The additional requirements that LCA data need to comply to in order to be included in the NMD are explained in more detail in section 2 and section 3. The core product category rule (PCR) followed is the NEN-EN15804 including amendment A2.

The verification checklist can be used by LCA verifiers recognized by both MRPI® and NMD Foundation:

| Company               | Represented by  |
|-----------------------|---|
| Pluk Sustainability   | Dr. N. (Niels) Jonkers                                  |

## 2. INTRODUCTION TO THE VERIFICATION CHECKLIST (PART A)

Section 3 contains the full checklist that integrates both the verification checklists of MRPI® and NMD Foundation. As required by the ECO Platform guidelines, the MRPI-verification checklist (following EN15804 + A2) served as starting point of this list. The MRPI-verification checklist has been expanded with a column (c5) which shows additional requirements that are prescribed by the Determination Method, but are not included in the MRPI-verification checklist. Figure 1 shows an impression of the checklist.

| c1  | c2   | c3  | c4      | c5  | c6  |
|-----|--|-----|---------|---|-----|
| 2   | Study goal – availability of info  | M/O | Ref. A2 | Determination Method (PCR_NL)   | C&A |
| 2.1 | Reasons for performing the LCA.  | M   | §8.2    |   |     |
| 2.2 | Intended application – (e.g. for EPD, databases, publication etc.)<br>Is the LCA designed in such a way that it allows B2B communication for environmental assessments of buildings? | M   | §8.2    |   |     |
|     |  | M   |         | this verification is for product cards in the NMD.                    |     |
|     |  | M   |         | Latest NMD format for product cards is used.                          |     |
|     |  | M   |         | Communication format is according to 2.8.2.2. of Determination Method |     |

Figure 1: Impression of the MRPI-verification checklist used for verification of the LCA report.

From left to right the checklist contains 6 columns (c1 – c6):

- Column c1:
  - o Adds a number to simplify communication between LCA-consultant and recognized LCA-verifier.
- Column c2:
  - o Describes the requirement to be assessed.
- Column c3:
  - o Determines whether the requirement is mandatory (M) or optional (O) to verify;
  - o The highlighted cells (grey) are requirements to be assessed specifically for the Determination Method.
- Column c4:
  - o Refers to the paragraph in EN15804+A2.
- Column c5:
  - o Explains and describes the requirements to be assessed specifically for the Determination Method.
- Column c6:
  - o Is filled/marked by the recognized verifier with “OK” if checked (C) and approved (A).

The verification checklist contains the minimal amount of required topics that have to be assessed. It is presented, and can be used as, a ‘tick-box’, but it should be clear from the verification report that discussions between the LCA-consultant and recognized LCA-verifier have taken place and (if applicable) improvements have been made according to the recognized LCA-verifier’s comments and recommendations. Usage of this document for the verification of LCA-data is limited to data presented in MRPI®-EPD’s to be included in the NMD.

The requirements included in the verification checklist in section 3 must be checked during the verification process. Most requirements are mandatory to check, some are optional. If, according to the verifier, the requirement is described in, and fulfilled by, the LCA report, the box “C & A[4]” can be ticked. C & A[4] stands for ‘checked’ and ‘approved’.

Any deviations from the requirements should be reported by the recognized LCA-verifier. The dialogue between the recognized LCA-verifier and the LCA-consultant should be made transparent, as well as the improvements made following the dialogue. This can be done separately from the checklist in the dialogue document (an example is provided after the checklist in ANNEX 3).

### 3. VERIFICATION CHECKLIST LCA PROJECT REPORT (PART A)

[1] M = Mandatory, O = Optional;

[2] Reference to the section of EN15804 + Amendment A2;

[3] Column with description of verifications specifically to the Determination Method (PCR\_NL);

[4] C = checked, A = Approved;

| 1   | General information - availability   | M/O[1] | Ref. A2[2]   | Determination Method (PCR_NL) [3]  | C & A[4] |
|-----|--|--------|--|--|----------|
| 1.1 | Commissioner of LCA study, LCA practitioner  | M      | §8.2   |  |          |
| 1.2 | Date of issue of LCA report  | M      | §8.2   |  |          |
| 1.3 | Statement that the LCA study has been performed in accordance with the requirements of EN 15804 and applicable PCRs  | M      | §8.2 + applicable PCR  |  |          |
| 1.4 | Any other independent verification of the data given in the LCI/LCA documentation?   | O      |  |  |          |
| 2   | Study goal – availability of info  | M/O[1] | Ref. A2  | Determination Method (PCR_NL)  | C & A[4] |
| 2.1 | Reasons for performing the LCA.  | M      | §8.2   |  |          |
| 2.2 | Intended application – (e.g. for EPD, databases, publication etc.)<br>Is the LCA designed in such a way that it allows B2B communication for environmental assessments of buildings? | M      | §8.2   |  |          |
|     |  | M      |  | This verification procedure is aiming to assess LCA data for inclusion in the NMD.               |          |
|     |  | M      |  | Most recent NMD format for submitting product cards has been used.                               |          |
|     |  | M      |  | It meets the communication format requirements described in 2.8.2.2. of the Determination Method |          |
| 2.3 | Target group (B2B, B2C, ...)   | M      | §8.2   |  |          |
| 3   | Functional unit / Declared unit – availability of info   | M/O[1] | Ref. A2  | Determination Method (PCR_NL)  | C & A[4] |
| 3.1 | Functional / Declared unit, including relevant technical specification   | M      | §6.3.1/6.3.2 and/or applicable PCR or additional specific requirements for |  |          |

**Verification checklist on the c-PCR-NL©**

|          |   |               |                        |  |                     |
|----------|---|---------------|------------------------|--|---------------------|
|          |   |               | certain product groups |  |                     |
|          |   | M             |                        | Contains the quantity of the function(s) expressed in a SI unit or a combination of SI-units.  |                     |
|          |   | M             |                        | Contains the weight of the construction product.   |                     |
|          |   | M             |                        | Contains the materialization of the construction product in terms of material description and weight.  |                     |
|          |   | M             |                        | The functional unit is consistent with NMD's functional descriptions and the most recent list can be found at <a href="http://www.milieudatabase.nl">www.milieudatabase.nl</a> . The correct reference to the functional description is included. It is clear whether a product is a 'total product' (totalproduct) or a 'sub-product' (deelproduct). If it is a total product, all compulsory components are verified as actually having been included in the study. If it is a sub-product, the total products and the component (CUAS) to which it belongs are clearly defined. |                     |
| 3.2      | If product groups (similar products from one manufacturer and/or from different production plants) are formed as averages:<br><br>a. Calculation rules for the formation of averages<br>b. Representativeness of averages   | M             | §8.2                   |  |                     |
|          |   | M             |                        | The average composition is based on:<br>- Annual figures or multi-year figures for all manufacturing, weighted by manufacturing;<br>- Or on a composition covering over 80% of the manufacturing volume in that year of study.   |                     |
| <b>4</b> | <b>Product description – availability of info</b>   | <b>M/O[1]</b> | <b>Ref. A2</b>         | <b>Determination Method (PCR_NL)</b>   | <b>C &amp; A[4]</b> |
| 4.1      | Composition of the product<br>The level of detail: the main components necessary to understand what type of product is concerned (detailed mass description is not necessary if confidential)<br><br>Note: It should be settled before the verification how confidential information is dealt with (acc. to provisions ISO 14025) | M             | ISO 14025              |  |                     |
| 4.2      | Description of technical and functional characteristics and area of intended application in the building  | M             | Applicable PCR         |  |                     |
| 4.3      | Flow diagram of main production processes and visualization of system boundaries. Level of detail: see 4.1  | M             | §7.2.1                 |  |                     |

## Verification checklist on the c-PCR-NL©

|     | Note: It should be settled before the verification how confidential information is dealt with (acc. to provisions ISO 14025)  |        |                             |  |          |
|-----|---|--------|-----------------------------|--|----------|
| 5   | System boundaries in accordance with the modular design of the EN 15804   | M/O[1] | Ref. A2                     | Determination Method (PCR_NL)  | C & A[4] |
| 5.1 | Comprehensive declaration of modules A1 to A3 as a minimum requirement, if necessary as an aggregated module A1-A3  | M      | §6.3.5                      |  |          |
|     |   | M      |                             | It is clearly indicated what the EPD type is:<br>1) only the production phase as a basic profile ("basisprofiel");<br>2) the entire lifecycle as product card ("productkaart").  |          |
|     |   | M      |                             | The life-cycle phases have been included in accordance with the Determination Method:<br>If 1): only production phase as "basisprofiel" modules A1-A3;<br>If 2): entire lifecycle as "productkaart" all modules A to D.          |          |
| 5.2 | A1 to A3: System boundary<br><br>a. Clear description of what the modules cover<br>b. System boundary to nature (e.g. forest in wood production)<br>c. Use of secondary materials and secondary fuels and waste produced (check end-of-waste state)<br>d. If applicable: Ref. A1 to the certificate of the offsetting of CO <sub>2</sub>  | M      | §6.3.5.2 and applicable PCR |  |          |
| 5.3 | A1 to A3: Allocation of co-products:<br><br>a. Specification of the "end-of-waste state"<br>b. Selection of the allocation factors for co-product allocation<br>c. Justification of specific allocation processes (e.g. if data are not available to allocate according to the EN15804 rules)<br>d. Presentation of the energy and material flows as a result of deviating allocation processes<br>e. No declaration of loads and benefits in Module D from allocation in A1-A3 | M      | §6.4.3.2 + annex B.1        |  |          |
| 5.4 | A4 to A5 (optional module): Clear description and content of modules  | M      | §6.3.5.3 and applicable PCR |  |          |
|     |   | M      |                             | Transport phase A4 starts when the construction product or component at the manufacturer's premises is ready for transport to the customer and ends when it is delivered at the construction site alongside the haulage vehicle. |          |
|     |   | M      |                             | Building and installation processes (A5) are included in the form of one or more scenarios. Default values for "material loss at the building site" are taken from §2.6.3.7 of the Determination Method. The default values are: |          |

Technical background complies with physical reality</li> </ol> | M             | <p>§6.3.8<br/>EN15941 and applicable PCR</p>  |   |                     |

## Verification checklist on the c-PCR-NL©

|           |  |               |                                    |   |                     |
|-----------|--|---------------|------------------------------------|---|---------------------|
|           | f. Integrity of generic data records, system limit and cut-off criteria for generic data records validity demonstrated   |               |                                    |   |                     |
|           |  | M             |                                    | If a supplier uses sector average data (category 2), the supplier must demonstrate to be part of this sector average or an equivalent.  |                     |
| 12.3      | Documentation on data / background data:<br>a. Name of the (background) data record, its source (data base, literary source etc.), year of data collection and its representativeness<br>b. Handling missing data<br>c. Assessing data quality | M             | EN15941 and applicable PCR         |   |                     |
|           |  | M             |                                    | All interventions from the latest CML-NMD method must be considered. Each intervention is allocated a value unless the value is not known. The options are:<br>1) A positive or negative value;<br>2) Value 0 for all interventions whose value is below the detection limit);<br>3) A question mark (?) (if it is not known whether the action will take place).<br>If NMD data or Ecoinvent is used, this requirement is in general not verified. |                     |
|           |  |               |                                    | The documentation format and datasets for the LCI used in the LCA, follow the current ILCD format and nomenclature as defined in the ILCD handbook.   |                     |
| 12.4      | Manufacturing data should be reproducible, e.g. by available data management systems. Random checks could be carried out, or based on importance; some data could be checked in the verification.  | O             |                                    |   |                     |
|           |  | M             |                                    | A justification of consistency of the LCA must be demonstrated by explanation of the used sources and operations to make the LCA consistent.  |                     |
| <b>13</b> | <b>Allocations</b>   | <b>M/O[1]</b> | <b>Ref. A2</b>                     | <b>Determination Method (PCR_NL)</b>  | <b>C &amp; A[4]</b> |
| 13.1      | General allocation principles applied (avoidance of allocation, no double counting / omissions, uniform application of the allocation rules etc.)  | M             | ISO14044:2006 4.3.4                |   |                     |
| 13.2      | Presentation and justification of allocations in the use of secondary materials or secondary fuels as raw materials  | M             | §6.4.3 and §8.2 and applicable PCR |   |                     |
| 13.3      | Presentation and justification of allocations in the plant (delineation from other products in a plant)  | M             |                                    |   |                     |

**Verification checklist on the c-PCR-NL©**

|           |   |               |                             |  |                     |
|-----------|---|---------------|-----------------------------|--|---------------------|
| 13.4      | If applicable: Presentation and justification of allocation of multi-input processes (e.g. landfilling or incineration)   | M             |                             |  |                     |
| 13.5      | Co-product allocation correctly applied, see also 5.3   | M             | §6.4.3.2                    |  |                     |
| 13.6      | Documentation of allocation factors used and their (independent) sources  | M             |                             |  |                     |
|           |   | M             |                             | Module D credits must be declared correctly. The following aspects are substantiated in this:<br>- a mass balance that includes all individual input flows of secondary raw materials and all output flows of materials for recycling;<br>- the quality and quantity of the recycling materials, used as secondary materials, must be determined;<br>- any waste flows from the recycling process are included;<br>- module D is calculated based on the sum of the net output of the individual flows of secondary raw materials. |                     |
| 13.7      | Allocation process for reuse, recycling and recovery, check specifically:<br>a. Consistency with other scenarios of waste management<br>b. Conventional average technologies and practices<br>c. Specification and justification of end-of-waste state where applicable<br>d. If applicable (module D): Selecting substituted processes in accordance with the PCR or (if no PCR is available) representative actual processes<br>e. If applicable (substitution in Module D): Calculation of net flows<br>f. Conservative approach, i.e. choice of those scenarios and calculation rules that reflect the highest environmental impacts in comparison to other choices | M             | §6.4.3.3 and applicable PCR |  |                     |
| 13.8      | Is there any presentation or expert guess of data sets which do not comply with the allocation principles and description of consequences for the LCA results?  | M             | Applicable PCR              |  |                     |
| <b>14</b> | <b>Life cycle modeling information</b>  | <b>M/O[1]</b> | <b>Ref. A2</b>              | <b>Determination Method (PCR_NL)</b>   | <b>C &amp; A[4]</b> |
| 14.1      | Transparent presentation of Life Cycle Assessment modeling (for example by tables, screenshots from Life Cycle Assessment software programs etc.)   | M             | §8.4                        |  |                     |
| 14.2      | Clear description how company data are used in which data records in Life Cycle Assessment software programs  | M             | §8.4                        |  |                     |
| 14.3      | Assignment of process data to the Life Cycle Assessment modules   | M             | §8.4                        |  |                     |

**Verification checklist on the c-PCR-NL©**

|      |  |   |      |  |  |
|------|--|---|------|--|--|
| 14.4 | For several locations/products: Presentation of modeling of all locations and products as well as weighting thereof  | M |      |  |  |
|      |  | M |      |  | If all manufacturing sites supply data when horizontal aggregation in the product system occurs, the result is automatically representative of the group in question. If manufacturing sites in the group do not all supply data, a representative cross-section of the group of manufacturing sites must be taken, provided that they manufacture for the Dutch market, in respect of geographical and technical differences that may lead to differences in environmental effects. |
|      |  | M |      |  | When aggregating environmental profiles, an 'average' environmental profile of a process is obtained. The average profiles are calculated on the basis of a weighted production quantity (Or production volume, if that is a customary unit) average of the selected manufacturing sites. Production quantities may be estimated in terms of order of magnitude.   |
| 14.5 | Plausibility and consistency of data (mass balance, energy balance)<br>Balances on company level and in the life cycle.<br>e.g. Mass balance between reference flow and wastes for cradle to grave data / Mass of non-energetic resources used coherent with the reference flow / CO and CO2 emissions coherent with the mass of fossil energetic resources / check of the sum of non-renewable and renewable parts or between feedstock and fuel parts / Is the energy indicators coherent with the energetic resources used? | M | §8.4 |  |  |
|      |  | M |      |  | For the processes that take place at the construction product manufacturer, the energy balance at company level must be determined and any discrepancies corrected to an accuracy of $\square$ 95%.  |
|      |  | M |      |  | For the processes that take place at the construction product manufacturer (if different from the data at company level), the mass balance (if different from the data at company level) must be determined for each process used and any discrepancies corrected to an accuracy of $\square$ 95%.   |
|      |  | M |      |  | Validity of the other processes must be checked by determining the mass balance of each process and correcting any discrepancies to an accuracy of $\geq$ 95%.   |

|      |  | M      |                                       | According to EN 15804 (A1):<br>Presentation of the parameters describing environmental impacts (7 parameters) and indicators describing toxicity (4 parameters). See ANNEX 2.<br>The environmental profile of set 1 (EN15804/A1:2013) consists of the eleven impact-categories mentioned in section 2.7.2.3 of the Determination Method. |          |
|      |  | M      |                                       | Uptake and emission of biogenic carbon is modelled in the Module where it occurs.  |          |
| 15.3 | Selection of correct characterization factors and elimination of long-term emissions (> 100 years)   | M      | §8.2 and annex C.4 and applicable PCR |  |          |
| 15.4 | Justification of characterisation factors applied in case of input/output flows that are not on the list of characterisation factors of the EN15804 and applicable PCR   | M      |                                       |  |          |
| 15.5 | Information on the environmental impacts in the project report:<br>a. Reference to characterisation models and factors<br>b. Statement that the estimated impact results are only relative statements which do not indicate the end points of the impact categories, exceeding threshold values, safety margins or risks   | M      | §8.2                                  |  |          |
|      |  | M      |                                       | The LCA report contains at least the information as described in §2.8 of the Determination Method  |          |
|      |  | M      |                                       | All environmental interventions of the most recent CML-NMD method (see <a href="http://www.milieudatabase.nl">www.milieudatabase.nl</a> ) and the ILCD handbook (identified by EN_15804) must be taken into account. Next interventions, as a minimum must have a result:  |          |

**Verification checklist on the c-PCR-NL©**

| 16   | Interpretation   | M/O[1] | Ref. A2  | Determination Method (PCR_NL)  | C & A[4] |
|------|--|--------|--|--|----------|
|      |  |        |  | <ul style="list-style-type: none"> <li>- Emissions to air of CO<sub>2</sub>, CO, NO<sub>x</sub> (NO<sub>2</sub> and NO), SO<sub>2</sub>, C<sub>x</sub>H<sub>y</sub> and particulate matter (PM10: parts &lt; 10 μm) when using thermal energy;</li> <li>- Emissions to water of CZV, BZV, P-total, N -total and particulate matter (PM10: parts &lt; 10 μm);</li> <li>- Emissions to soil of PAK and heavy metal content;</li> <li>- Other emissions as demanded by legislation to the manufacturer.</li> </ul>  |          |
| 16.1 | Interpretation of the results based on a dominance/contribution analysis of selected indicators  | O      |  |  |          |
|      |  | M      |  | <p>A sensitivity analysis has been conducted and contains:</p> <ul style="list-style-type: none"> <li>- The influence of geographical and technological spread within a group of production sites. Use the highest and the lowest values in the sensitivity analysis;</li> <li>- The distribution as a result of dispersion in an average composition. Use the highest and the lowest values in the sensitivity analysis;</li> <li>- The distribution as a result of centring when setting up a group average. Use the highest and the lowest values in the sensitivity analysis.</li> </ul> |          |
| 16.2 | Relationship between the results of the Life Cycle Inventory Assessment and the results of the Life Cycle Impact Assessment (LCIA)                                 | M      | §8.2   |  |          |
| 16.3 | Assumptions and restrictions as regards the interpretation of results in the EPD, in terms of both methods and data  | M      | §8.2   |  |          |
| 16.4 | Variance from the means of LCIA results must be presented if generic data is provided from several sources or [the results] refer to a number of similar products. | M      | §8.2   |  |          |
|      |  | M      |  | <p>The differences may not exceed 20% on one of the environmental impacts compared to the average value. If the sensitivity analysis shows that the differences are higher than 20%, the environmental product declarations must be split up to stay below the 20% limit. It is also possible to choose to display the worst-case profiles. The variations in environmental impacts with very low values can be dealt with in this way.</p>  |          |
| 16.5 | Data quality assessment  | M      | §8.2<br>ISO 14040<br>CEN TR15941<br>Applicable PCR |  |          |
| 16.6 | Comprehensive transparency as regards value decisions, justifications and expert opinions  | M      | §8.2   |  |          |

## Verification checklist on the c-PCR-NL©

| 17   | Additional information  | M/O[1] | Ref. A2 | Determination Method (PCR_NL)  | C & A[4] |
|------|---|--------|---------|--|----------|
| 17.1 | Where relevant to check the documentation:<br><br>a. Laboratory results/measurements listed in the content declaration<br>b. Laboratory results/measurements listed in the functional/technical performance<br>c. Documentation on the declared technical information on individual life cycle stages not taken into consideration in the construction product's Life Cycle Assessment and applied for evaluation of the building (e.g. transport routes, energy consumption during the usage stage, cleaning cycles etc.)<br>d. Laboratory results/measurements pertaining to the declared emissions in indoor air, soil or water during the use stage | M      | §8.3    |  |          |
| 17.2 | Where relevant: ensure that information additional to EN15804 is verified   |        |         |  |          |
| 18   | Documentation for calculating the reference service life (RSL)  | M/O[1] | Ref. A2 | Determination Method (PCR_NL)  | C & A[4] |
| 18.1 | Necessary if the entire life cycle A1-C4 is declared: Documentation for calculating the reference service life (RSL), should be representative for the declared product   | M      | §6.3.4  |  |          |
|      |   | M      |         | <p>If the entire life cycle A-D is explained, the reference service life (RSL) is based on the reference service life of each type of construction product in the SBR publication "<i>Levensduur van bouwproducten</i>" (Service life of construction products) [SBR, 2011].</p> <p>The document is available at:<br/> <a href="https://milieudatabase.nl/milieuprestatie/bepalingsmethode/">https://milieudatabase.nl/milieuprestatie/bepalingsmethode/</a></p> <p>If substantiated, it is possible to deviate from this rule. Documentation is then required to calculate the RSL. The RSL must be representative for the specified product in the specified application(s).</p> |          |

## **ANNEX 1: VERIFICATION CHECKLIST (PART B) REQUIREMENTS ON THE MRPI®-EPD CERTIFICATE**

This is a separate document and will be added later.

## ANNEX 2: FULL LIST OF ENVIRONMENTAL INDICATORS TO BE DECLARED AND TO BE TAKEN INTO THE NMD.

Environmental Indicators according to EN15804 + amendment A1

| INDICATOR | UNIT              | DESCRIPTION   |
|-----------|-------------------|---|
| ADPE      | [kg Sb eq.]       | ADPE = Abiotic Depletion Potential for non-fossil resources             |
| ADPF*     | [MJ]              | ADPF = Abiotic Depletion Potential for fossil resources                 |
| GWP       | [kg CO2 eq.]      | GWP = Global Warming Potential  |
| ODP       | [kg CFC11 eq.]    | ODP = Depletion potential of the stratospheric ozone layer              |
| POCP      | [kg ethene eq.]   | POCP = Formation potential of tropospheric ozone photochemical oxidants |
| AP        | [kg SO2 eq.]      | AP = Acidification Potential of land and water                          |
| EP        | [kg (PO4 )3- eq.] | EP = Eutrophication Potential   |

Indicators describing toxicity (specific for Dutch market)

| INDICATOR | UNIT        | DESCRIPTION                                       |
|-----------|-------------|---|
| HTP       | [kg DCB-Eq] | HTP = Human Toxicity Potential                    |
| FAETP     | [kg DCB-Eq] | FAETP = Fresh water aquatic ecotoxicity potential |
| MAETP     | [kg DCB-Eq] | MAETP = Marine aquatic ecotoxicity potential      |
| TETP      | [kg DCB-Eq] | TETP = Terrestrial ecotoxicity potential          |

Indicators shown on the MRPI®-EPD

| INDICATOR | UNIT        | DESCRIPTION  |
|-----------|-------------|--|
| ECI       | [euro]      | ECI = Environmental Cost Indicator   |
| ADPF*     | [kg Sb eq.] | ADPF = Abiotic Depletion Potential for fossil resources expressed in [kg Sb-eq.] |

- \* ADPF is according to EN15804 + A1 expressed in MJ. The NMD takes ADPF expressed in [kg Sb eq.].  
 Multiplying ADPF in MJ by 4,81E-4 kg Sb/MJ gives ADPF in [kg Sb eq.]

## Verification checklist on the c-PCR-NL©

### Core Environmental Indicators according to EN15804 + amendment A2

| INDICATOR           | UNIT                      | DESCRIPTION   |
|---------------------|---------------------------|---|
| GWP-total           | [kg CO2 eq.]              | GWP-total = Global Warming Potential total  |
| GWP-fossil          | [kg CO2 eq.]              | GWP-fossil = Global Warming Potential fossil fuels  |
| GWP-biogenic        | [kg CO2 eq.]              | GWP-biogenic = Global Warming Potential biogenic  |
| GWP-luluc           | [kg CO2 eq.]              | GWP-luluc = Global Warming Potential land use and land use change                                   |
| ODP                 | [kg CFC11 eq.]            | ODP = Depletion potential of the stratospheric ozone layer  |
| AP                  | [mol H+ eq.]              | AP = Acidification Potential, Accumulated Exceedence  |
| EP-freshwater       | [kg PO4 eq.]              | EP-freshwater = Eutrophication Potential, fraction of nutrients reaching freshwater end compartment |
| EP-marine           | [kg N eq.]                | EP-marine = Eutrophication Potential, fraction of nutrients reaching marine end compartment         |
| EP-terrestrial      | [mol N eq.]               | EP-terrestrial = Eutrophication Potential, Accumulated Exceedence                                   |
| POCP                | [kg NMVOC eq.]            | POCP = Formation potential of tropospheric ozone photochemical oxidants                             |
| ADP-minerals&metals | [kg Sb eq.]               | ADP-minerals&metals = Abiotic Depletion Potential for non fossil resources                          |
| ADP-fossil          | [MJ, net calorific value] | ADP-fossil = Abiotic Depletion for fossil resources potential                                       |
| WDP                 | [m3 world eq. Deprived]   | WDP = Water (user) deprivation potential, deprivation-weighted water consumption                    |

### Additional Environmental Indicators according to EN15804 + amendment A2

| INDICATOR | UNIT              | DESCRIPTION  |
|-----------|-------------------|--|
| PM        | Disease incidence | PM = Potential incidence of disease due to PM emissions          |
| IRP       | kBq U235 eq.      | IRP = Potential Human exposure efficiency relative to U235       |
| ETP-fw    | CTUe              | ETP-fw = Potential Comparative Toxic Unit for ecosystems         |
| HTP-c     | CTUh              | HTP-c = Potential Comparative Toxic Unit for humans              |
| HTP-nc    | CTUh              | HTP-nc = Potential Comparative Toxic Unit for humans, non-cancer |
| SQP       | ----              | SQP = Potential soil quality index                               |

## Verification checklist on the c-PCR-NL©

Parameters describing resource use according to EN15804 + amendment A2

| INDICATOR | UNIT | DESCRIPTION  |
|-----------|------|--|
| PERE      | [MJ] | PERE = Use of renewable energy excluding renewable primary energy resources  |
| PERM      | [MJ] | PERM = Use of renewable energy resources used as raw materials   |
| PERT      | [MJ] | PERT = Total use of renewable primary energy resources   |
| PENRE     | [MJ] | PENRE = Use of non-renewable primary energy resources excluding non-renewable energy resources used as raw materials |
| PENRM     | [MJ] | PENRM = Use of non-renewable primary energy resources used as raw materials  |
| PENRT     | [MJ] | PENRT = Total use of non-renewable primary energy resources  |
| SM        | [kg] | SM = Use of secondary materials  |
| RSF       | [MJ] | RSF = Use of renewable secondary fuels   |
| NRSF      | [MJ] | NRSF = Use of non renewable secondary fuels  |
| FW        | [m3] | FW = Use of net fresh water  |

Environmental information describing output flows and waste categories according to EN15804 + amendment A2

| INDICATOR | UNIT | DESCRIPTION                         |
|-----------|------|-------------------------------------|
| HWD       | [kg] | HWD = Hazardous Waste Disposed      |
| NHWD      | [kg] | NHWD = Non Hazardous Waste Disposed |
| RWD       | [kg] | RWD = Radioactive Waste Disposed    |
| CRU       | [kg] | CRU = Components for reuse          |
| MFR       | [kg] | MFR = Materials for recycling       |
| MER       | [kg] | MER = Materials for energy recovery |
| EEE       | [MJ] | EEE = Exported Electrical Energy    |
| ETE       | [MJ] | ETE = Exported Thermal Energy       |

Information on biogenic carbon content according to EN15804 + amendment A2

| INDICATOR | UNIT   | DESCRIPTION                                  |
|-----------|--------|--|
| BCCpr     | [kg C] | BCCpr = Biogenic carbon content in product   |
| BCCpa     | [kg C] | BCCpa = Biogenic carbon content in packaging |

### **ANNEX 3: EXAMPLE DIALOGUE DOCUMENT**

The dialogue document is the same for both a conventional verification and a verification including the c-PCR-NL. For the sake of completeness, an example of dialogue between verifier/Program Operator and EPD owner / practitioner during the verification process is added to the Determination Method (PCR\_NL).

Any deviations from the requirements should be reported by the verifier, and the dialogue between verifier and LCA practitioner should be made transparent as well improvements made following the verification process. This can be done separate from the checklist. The format to do so is free to choose. Examples are given below:

*Example:*

| Issue number | Question / comment | Response |
|--------------|--------------------|----------|
|              |                    |          |
|              |                    |          |

*Example (partly based on XP TS14071)*

| Comment N° | Chapter Article Paragraph | Alinea Table | Type of comment (Ed, Te, Ge)* | Ref. to a Eco check list | Verifier comment and recommendation | EPD owner / LCA practitioner answer | Final verifier statement |
|------------|---------------------------|--------------|-------------------------------|--------------------------|-------------------------------------|-------------------------------------|--------------------------|
|            |                           |              |                               |                          |                                     |                                     |                          |

\*Ed = Editorial

\*Te = Technical

\*Ge = General

## ANNEX 4: EXAMPLE FINAL VERIFICATION STATEMENT

Report on verification of the MRPI®-Environmental Product Declaration ..... [Registration number]

For ..... [Product] by ..... [Company]

**Verification statement:**

The MRPI® recognized verifier shall give a statement about his work and the result, clarifying at minimum:

- the MRPI®-EPDs concerned;
- that the work concerned a verification (not a certification);
- that the verification has been done 3<sup>rd</sup> party independent;
- that the MRPI®-EPD was verified according to EN 15804+A2;
- that Determination Method (PCR\_NL) was used.

Example:

I hereby confirm that, following detailed examination as independent 3<sup>rd</sup> party verifier, I have not been able to trace any relevant deviations by:

The Environmental Product Declaration: ..... [MRPI® registration number]

Issued for: ..... [product name(s)]

By: ..... [company name]

and by its project report from the requirements outlined in the corresponding product category regulations based on:

- EN 15804+A2
- Determination Method (PCR\_NL)
- .....

The company-specific data have been examined as regards plausibility and consistency; the declaration owner is responsible for its factual integrity.

The project report on the Life Cycle Assessment is filed at ..... [Manufacturer]

and the report(s) on features of environmental relevance are filed at Stichting MRPI®.

Name and signature of

external recognized verifier
